

# NETSCOPE *FastTrack*

**NetScope FastTrack offers an extensive network management solution, combining the benefits of instant control of application performance and dynamic allocation of network resources with comprehensive visualisation and analysis tools.**

## Managing the network

When the applications and services that business depends upon compete for available bandwidth the end result can be intermittent and short duration network log jams which can lead to severe network degradation.

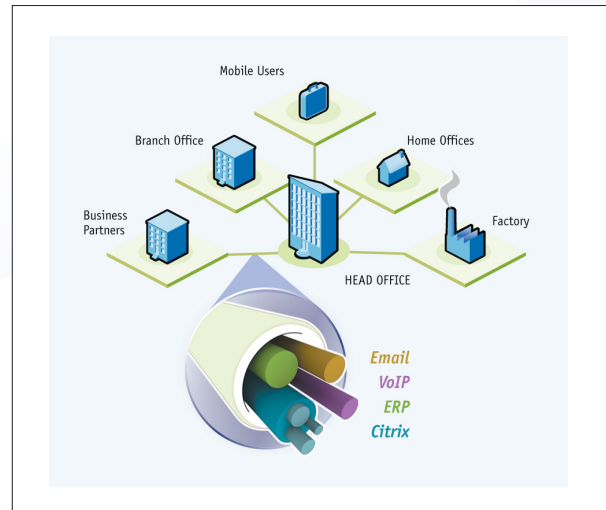

Without performance management, critical IT infrastructure can become a drain on resources, rather than presenting new opportunities to gain strategic and competitive advantage.

## Enterprise wide traffic control

NetScope FastTrack features instant control of application performance and dynamic allocation of network resources to ensure that you are always in control of the network. Prioritise business critical and revenue generating applications by guaranteeing the bandwidth they needed to maintain and enhance performance while lower priority or unwanted traffic can be shaped, capped or blocked as desired.

Additionally, NetScope FastTrack utilises many of the extensive monitoring and visualisation tools also found in NetScope Analyser, including traffic visualisation down to a per second resolution for both real time and historical analysis.

This delivers a solution which not only gives you the power to quickly and easily diagnose and pinpoint network slow downs but to then take action to resolve those performance issues.

## ★ Key features and benefits

- Provide Quality of Service (QoS) to your business critical applications by giving them the required amount of bandwidth to maintain and enhance application performance, even when competing traffic exists.
- Unwanted peer to peer traffic? Facebook? Youtube? Cap or eliminate unwanted, recreational or non business critical traffic.
- Maximise the performance of your existing network infrastructure through dynamic bandwidth allocation and reallocation. Avoid unnecessary increases in network infrastructure costs by increasing performance, not bandwidth.
- Real time shaping policy deployment, respond to network performance issues as they occur.
- Limit the impact of large file transfers on user traffic.
- Block a virus-infected machine.

### ★ Key features and benefits

- Centralised and simplify management by reducing the cost and complexity of managing diverse networks.
- Hierarchical shaping with Classes, Sub-Classes and Filters.
- Failover and out-of-band management.
- Total visibility and control - Take the guess work out of monitoring and managing your network by taking advantage of real time and historical per second visualisation.
- Provides instant visibility and control.
- Drill down capability allows you to see the true composition of your Network traffic. Zero in on problem traffic to effectively isolate problems and resolve them.
- Use as a valuable support tool - Network problems can be extremely difficult to diagnose. Having the visibility and application prioritisation tools that NetScope FastTrack provides across your network means finding and resolving problems is quick, easy and can be performed remotely.
- Cost effective solution – can be upgraded or expanded without having to upgrade your appliance.

### Strong Return On Investment

Simply increasing bandwidth won't stop traffic spikes and resolve issue with low latency critical applications such as Voice over IP (VoIP).

NetScope FastTrack helps to reduce expenditure by maximising the capabilities and usage of your existing infrastructure. In most cases, you will be able to quickly and easily achieve the same or better performance across your WAN with **less** bandwidth.

With the knowledge gained through monitoring features, you'll be able to make informed decisions about the needs of your organisation now and in the future.
